Unit â€“ 4 : Session â€“ 11 : SLO â€“ 1 | UDP Socket Behaviour

I. Fill in the Blanks

1. UDP does not guarantee reliable or ordered delivery (packets may be lost, duplicated or arrive out of order).

2. sendto() is used to send data along with a destination address (host, port) â€” UDP has no connection to default to.

II. Multiple Choice

1. b) Unreliable and fast â€” UDP trades reliability for minimal overhead and low latency.
