Unit 4 · Session 10 · SLO 2 — Solved Worksheet

Name: R L KRISHE YADAV R L KRISHE YADAV | **Reg. No:** RA2511030010473

Unit â€“ 4 : Session â€“ 10 : SLO â€“ 2 | Client-Server Communication Using the socket Module

I. Steps to Create a Simple TCP Server

1. Create the socket: s = socket.socket(socket.AF_INET, socket.SOCK_STREAM) # IPv4 + TCP
2. Bind it to an address: s.bind(("localhost", 5000))
3. Start listening: s.listen(1) # backlog of 1 pending connection
4. Accept a client: conn, addr = s.accept() # blocks until a client connects
5. Exchange data: data = conn.recv(1024); conn.send(b"Hello client")
6. Close both sockets: conn.close(); s.close()

II. Minimal Working Example

- import socket
- s = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
- s.bind(("localhost", 5000))
- s.listen(1)
- conn, addr = s.accept()
- print("Connected:", addr)
- conn.sendall(b"Welcome")
- conn.close(); s.close()
