## Unit â€“ 4 : Session â€“ 9 : SLO â€“ 2 | TCP and UDP Socket Types

### I. Match the Following

1. TCP â€” Reliable, ordered: connection-oriented byte stream with acknowledgements, retransmission and sequencing.
2. UDP â€” Fast, no guarantee: connectionless datagrams with no delivery or ordering guarantee, minimal overhead.
3. Port â€” Logical communication endpoint: a 16-bit number identifying a specific process/service on a host.

### II. Key Notes

• TCP use cases: web (HTTP/HTTPS), email, file transfer â€” where correctness matters.

• UDP use cases: live video/voice, DNS, online gaming â€— where speed matters more than perfection.

• A socket = IP address + port + protocol; TCP sockets are SOCK_STREAM, UDP sockets are SOCK_DGRAM.
